1. Overview

1.1 Introduction

E220-900T30S is a new generation of LoRa wireless serial port module (UART), based on Semtech's original LLCC68 chip design. It has a variety of transmission methods, works in the (850.125 ~ 930.125MHz) frequency band (default 873.125MHz), LoRa spread spectrum technology, TTL level output, compatible with 3.3V and 5V IO port voltage.

E220-900T30S adopts a new generation of LoRa solution. Compared with the traditional SX1276 solution, the transmission distance is longer, the speed is faster, and the power consumption is lower; it supports functions such as air wake-up, carrier monitoring, and communication key, and supports sub-packet length setting. Ebyte can provide customized development services. Compared with the LLCC68 scheme, this scheme has a high cost performance advantage. The product can cover an ultra-wide frequency range of 850~930MHz.

1.2 Features

- Using LLCC68 chip solution, it has significant advantages of low power consumption, fast speed and long distance;
- Under ideal conditions, the communication distance can reach 10km;
- The maximum transmit power is 30dBm, and the software is multi-level adjustable;
- Support users to set the communication key by themselves, and it cannot be read, which greatly improves the confidentiality of user data;
- Support RSSI signal strength indicator function for evaluating signal quality, improving communication network, and ranging;
- Support air wakeup, that is, ultra-low power consumption function, suitable for battery-powered applications;
- Support fixed-point transmission, broadcast transmission, channel monitoring;
- Support the global ISM 868/915MHz frequency band;
- The parameters are saved after power off, and the module will work according to the set parameters after power on again;
- Efficient watchdog design. Once an exception occurs, the module will automatically restart and continue to work according to the previous parameter settings;
- Support the data transmission rate of 2.4k~62.5kbps;
- Support 2.3~5.5V power supply, power supply greater than 5V can guarantee the best performance;
- Industrial standard design, supporting long-term use at -40~+85°C;
- Dual antennas are optional (IPEX/stamp hole), which is convenient for users to develop and integrate.

1.3 Application

- Home security alarm and remote keyless entry ;
- Smart home and industrial sensors ;
- Wireless alarm security system ;
- Building automation solutions ;

2. Specifications and Parameters

2.1 Limit parameter

Main parameter	Performance		Remark
	Min.	Max.	
Power supply (V)	2.3	5.5	Voltage over 5.5V will cause permanent damage to module
Blocking power (dBm)	-	10	Chances of burn is slim when modules are used in short distance
Operating temperature (°C)	-40	+85	Industrial grade

2.2 Operating parameter

Main parameter		Performance			Remark
		Min.	Typ.	Max.	
Operating voltage (V)		3.3	5.0	5.5	≥5.0 V ensures output power
Communication level (V)		-	3.3	-	For 5V TTL, it may be at risk of burning down
Operating temperature (°C)		-40	-	+85	Industrial design
Operating frequency (MHz)		850.125	-	930.125	Support ISM band
Power consumption	TX current (mA)	-	610	-	Instant power consumption @30dBm
	RX current (mA)	-	17	-	-
	Sleep current (μA)	-	3	-	Software is shut down
Max Tx power (dBm)		29.5	30.0	30.5	-
Receiving sensitivity (dBm)		-	-129	-	-124dbm,BW_L=125kHz,SF = 7,LORA™; -129dbm,BW_L=125kHz,SF = 9,LORA™; -121dbm,BW_L=250kHz,SF = 7,LORA™; -129dbm,BW_L=250kHz,SF = 10,LORA™; -117dbm,BW_L=500kHz,SF = 7,LORA™; -127dbm,BW_L=500kHz,SF = 11,LORA™;
Air data rate (bps)		2.4k	2.4k	62.5k	Controlled via user's programming
Distance for reference		10km			Test condition : clear and open area, antenna gain: 5dBi, antenna height: 2.5m, air data rate: 2.4kbps
TX length		200 Btye			Can be configured via command as 32/64/128/200 bytes per packet to transmit
Buffer		400 Btye			-
Modulation		LoRa			New generation LoRa modulation technology
Communication interface		UART			TTL Level
Package		SMD			-
Connector		1.27mm			Stamp hole
Size		25*40.5 mm			-
Antenna		IPEX/Stamp hole			50 ohm impedance

3. Size and Pin Definition

No.	Name	Direction	Function
1	GND	Input	Ground
2	VCC	Input	Power supply : 3.3~ 5.5V DC
3	AUX	Output	To indicate module 's working status & wakes up the external MCU. During the procedure of self-check initialization, the pin outputs low level. Can be configured as push-pull output (can be suspended).
4	TXD	Output	TTL UART outputs, connects to external RXD (MCU, PC) input pin. Can be configured as open-drain or push-pull output
5	RXD	Input	TTL UART inputs, connects to external (MCU, PC) TXD output pin. Can be configured as open-drain or pull-up input. Ground
6	M1	Input (weak pull-up)	Work with M0 to decide 4 working modes of module (not suspended, if not used, could be grounded).

7	M0	Input (weak pull-up)	Work with M1 to decide 4 working modes of module (not suspended, if not used, could be grounded).
11	ANT	output	High frequency signal output, 50 ohm characteristic impedance
12	GND		Ground
13	GND		Ground
14	GND		Ground
18	NC	Input/output	can be suspended
19	NC	Input/output	can be suspended
20	NC	Input/output	can be suspended
21	NC	Input	can be suspended
22	NC	Input	can be suspended
23	GND	Input	Ground
24	NC	Input	can be suspended

4. Connect to MCU

No.	Brief description of the connection between the module and the MCU (The picture above takes STM8L MCU as an example)
1	The wireless serial port module is TTL level, please connect with TTL level MCU.
2	For some MCU works at 5VDC, it may need to add 4-10K pull-up resistor for the TXD & AUX pin.

5. Function Description

5.1 Fixed Transmission

5.2 Broadcasting Transmission

5.3 Broadcasting address

- For example: Set the address of module A as 0xFFFF or 0x0000, and the channel as 0x04;
- When module is the transmitter (transparent transmission), all modules under channel 0x04 will receive the data, the purpose of broadcast is realized.

5.4 Monitor address

- For example: Set the address of module A as 0xFFFF or 0x0000, and the channel as 0x04;
- When module A is the receiver, it can receive the data sent from all modules under channel 0x04, the purpose of monitor is realized.

5.5 Reset

When the module is powered, AUX outputs low level immediately, conducts hardware self-check and sets the operating mode based on user's parameters. During the process, the AUX remains low level. After the process completed, the AUX outputs high level and starts to work as per the operating mode combined by M1 and M0. Therefore, users need to wait the AUX rising edge as the start of module's normal work.

5.6 AUX description

- AUX Pin can be used as indication for wireless send & receive buffer and self-check.
- It can indicate whether there are data that are not sent yet via wireless way, or whether all wireless data has been sent through UART, or whether the module is still in the process of self-check initialization.

5.6.1 Indication of UART output

To wake up the external MCU

Timing Sequence Diagram of AUX when TXD pin transmits

5.6.2 Indication of wireless transmitting

- Buffer empty: the data in the internal 400-byte buffer is written to the wireless chip (automatic sub-packaging); When AUX=1, the user continuously initiates data less than 400 bytes without overflow; When AUX=0, the buffer is not empty: the data in the internal 400-byte buffer has not been written to the wireless chip and the transmission is started. At this time, the module may be waiting for the end of the user data to time out, or the wireless sub-packet transmission is in progress.
[Note]: When AUX=1, it does not mean that all serial port data of the module has been transmitted wirelessly, and the last packet of data may be being transmitted.

Timing Sequence Diagram of AUX when RXD pin receives

5.6.3 Configuration procedure of module

- Only happened when power-on resetting or exiting sleep mode

Timing Sequence Diagram of AUX when self-check

5.6.4 Notes for AUX

No.	AUX Description
1	For function 1 & function 2 mentioned above, the priority should be given to the one with low level output, which means if it meets each of any low level output condition, AUX outputs low level, if none of the low level condition is met, AUX outputs high level.
2	When AUX outputs low level, it means the module is busy & cannot conduct operating mode checking. Within 1ms since AUX outputs high level, the mode switch will be completed.
3	After switching to new operating mode, it will not work in the new mode immediately until AUX rising edge lasts for 2ms. If AUX stays on the high level, the operating mode switch can be affected immediately.
4	When the user switches to other operating modes from mode 3 (sleep mode) or it's still in reset process, the module will reset user parameters, during which AUX outputs low level.
5	Due to the characteristics of the LoRa modulation method, the information transmission delay is much longer than that of FSK. For example, at 2.4kbps airspeed, the 100-byte transmission delay is about 1.5 seconds. It is recommended that customers do not transmit large amounts of data at low airspeeds. , So as to avoid communication abnormalities caused by data loss due to data accumulation.

6. Operating Mode

There are four operating modes, which are set by M1 and M0, the details are as follows:

Mode (0-3)	M1	M0	Description	Remark
0 Transmission Mode	0	0	UART and wireless channel are open, transparent transmission is on	—
1 WOR Transmitting Mode	0	1	WOR transmits data, WOR receives data	Supports wake up over air
2 WOR Receiving Mode	1	0	WOR transmitting is closed, WOR receiving data	—
3 Deep Sleep Mode	1	1	Parameters can be configured	—

6.1 Mode Switching

No.	Remark
-----	--------

1	<ul style="list-style-type: none"> ● Users can combine M1 and M0 with high and low levels to determine the operating mode. Two GPIOs of the MCU can be used to control mode switching; ● After changing M1 and M0: If the module is idle, after 1ms, it can start working according to the new mode; ● If the serial port data of the module has not been transmitted through the wireless, the new working mode can be switched after the transmission is completed; ● If the module receives the wireless data and transmits the data through the serial port, it needs to finish transmission before switching the new working mode; ● Therefore, mode switching can only be valid when AUX output is 1, otherwise it will delay switching
2	<ul style="list-style-type: none"> ● For example, users continuously input a large amount of data and simultaneously performs mode switching. At this time, the switching mode operation is invalid; the module will process all the user data before performing the new mode detection; ● Therefore, the general recommendation is to detect the output state of the AUX pin and switch after 2ms when the output is high.
3	<ul style="list-style-type: none"> ● When the module is switched from other modes to sleep mode, if the data has not been processed yet; ● The module will process these data (including receiving and sending) before entering sleep mode. This feature can be used for fast sleep, which saves power; for example, the transmitter module works in mode 0, the user transmits the serial port data "12345", and then does not have to wait for the AUX pin to be idle (high level), and can directly switch to sleep mode. And the user's main MCU immediately sleeps, the module will automatically transmit the user data through the wireless, and automatically enters sleep within 1ms; ● This saves MCU's working time and reduces power consumption.
4	<ul style="list-style-type: none"> ● Similarly, any mode switching can use this feature. After the module processes the current mode event, it will automatically enter the new mode within 1ms; thus, eliminating the need for the user to query AUX and achieve the purpose of fast switching; ● For example, switching from the transmit mode to the receive mode; the user MCU can also enter sleep before the mode switch, and use the external interrupt function to acquire the AUX change, thereby performing mode switching.
5	<ul style="list-style-type: none"> ● This operation mode is very flexible and efficient, and is designed according to the user's MCU's operation convenience, and can reduce the workload of the entire system as much as possible, improve system efficiency, and reduce power consumption.

6.2 Normal mode (Mode 0)

Type	When M0 = 0, M1 = 0, the module works in mode 0
Transmitting	Users can input data through the serial port and the module will start wireless transmission.
Receiving	The module wireless receiving function is turned on, and after receiving the wireless data, it will be output through the serial port TXD pin.

6.3 WOR sending mode (Mode 1)

Type	When M0 = 1, M1 = 1, the module works in mode 1
Transmitting	Wireless data transmitting is turned on.
Receiving	Wireless data reception is turned on.

6.4 WOR receiving mode (Mode 2)

Type	When M0 = 0, M1 = 1, the module works in mode 2
Transmitting	Wireless transmission is off.
Receiving	Wireless data reception is turned on.

6.5 Deep Sleep Mode (Mode 3)

Type	When M0 = 1, M1 = 1, the module works in mode 3
Transmitting	Unable to transmit wireless data
Receiving	Unable to receive wireless data
Configuring	Users can access the registers to configure the working status of the module
Note	When from the sleep mode to other modes, the module will reconfigure the parameters. During the configuration process, AUX will remain low; After configuration, it outputs high level, we suggest that user test rising edge T_BUSY.

7. Register Read and Write Control

7.1 Command Format

In configuration mode (mode 3: M1=1, M0=1), the supported command list is as follows (when setting, only 9600, 8N1 format is supported):

No	Command Format	Description												
1	Set Register	Command: C0+starting address+length+parameters Response: C1+starting address+length+parameters Example 1: Channel is 0x09 <table border="0" style="margin-left: 20px;"> <tr> <td>command</td> <td>starting address</td> <td>length</td> <td>parameter</td> </tr> <tr> <td>Send: C0</td> <td>05</td> <td>01</td> <td>09</td> </tr> <tr> <td>Return: C1</td> <td>05</td> <td>01</td> <td>09</td> </tr> </table> Example 2: Configure module address (0x1234), serial port (9600 8N1), air speed (2.4K) Send: C0 00 04 12 34 00 61 Return: C1 00 04 12 34 00 61	command	starting address	length	parameter	Send: C0	05	01	09	Return: C1	05	01	09
command	starting address	length	parameter											
Send: C0	05	01	09											
Return: C1	05	01	09											

2	Read Register	<p>Command: C1+starting address+parameters Response: C1+starting address+length+parameters</p> <p>Example : Read channel</p> <table border="1"> <tr> <td>command</td> <td>starting address</td> <td>length</td> <td>parameter</td> </tr> <tr> <td>Send: C1</td> <td>05</td> <td>01</td> <td></td> </tr> <tr> <td>Return: C1</td> <td>05</td> <td>01</td> <td>09</td> </tr> </table> <p>Example 2: Read module address, serial port, and airspeed at the same time</p> <p>Send: C1 00 04 Return: C1 00 04 12 34 00 61</p>	command	starting address	length	parameter	Send: C1	05	01		Return: C1	05	01	09
command	starting address	length	parameter											
Send: C1	05	01												
Return: C1	05	01	09											
3	Set Temporary Register	<p>Command: C2+starting address+parameters Response: C1+starting address+length+parameters</p> <p>Example 1: Channel is 0x09</p> <table border="1"> <tr> <td>command</td> <td>starting address</td> <td>length</td> <td>parameter</td> </tr> <tr> <td>Send: C2</td> <td>05</td> <td>01</td> <td>09</td> </tr> <tr> <td>Return: C1</td> <td>05</td> <td>01</td> <td>09</td> </tr> </table> <p>Example 2: Configure module address (0x1234), network address (0x00), serial port (9600 8N1) and air data rate (2.4K)</p> <p>Send: C2 00 04 12 34 00 61 Return: C1 00 04 12 34 00 61</p>	command	starting address	length	parameter	Send: C2	05	01	09	Return: C1	05	01	09
command	starting address	length	parameter											
Send: C2	05	01	09											
Return: C1	05	01	09											
4	Wrong Format	Wrong format responds FF FF FF												

7.2 Register Description

Address	Read or Write	Name	Description	Remark	
00H	Read/Write	ADDH	ADDH (default 0)	High byte and low byte of module address; Note: When the module address is equal to FFFF, it can be used as the broadcast and monitor address, that is: the module will not perform address filtering at this time	
01H	Read/Write	ADDL	ADDL (default 0)		
02H	Read/Write	REG0	7 6 5	UART Serial Port Rate (bps)	For the two modules that communicate with each other, the serial port baud rate can be different, and the verification method can also be different; When continuously transmitting large data packets, users need to consider the data congestion caused by the same baud rate, and may even be lost; It is generally recommended that the baud rate of the two communication parties be the same.
			0 0 0	UART Rate is 1200	
			0 0 1	UART Rate is 2400	
			0 1 0	UART Rate is 4800	
			0 1 1	UART Rate is 9600 (default)	
			1 0 0	UART Rate is 19200	
			1 0 1	UART Rate is 38400	
			1 1 0	UART Rate is 57600	
			1 1 1	UART Rate is 115200	
		4 3	Serial Parity Bit	The serial port mode of the communication parties can be different;	
		0 0	8N1 (default)		
		0 1	8O1		
1 0	8E1				
1 1	8N1 (equal to 00)				

			2	1	0	Air Data Rate (bps)	The air rate of both parties must be the same; The higher the air rate, the smaller the delay and the shorter the transmission distance.	
			0	0	0	Air Data Rate 2.4k		
			0	0	1	Air Data Rate 2.4k		
			0	1	0	Air Data Rate 2.4k (default)		
			0	1	1	Air Data Rate 4.8k		
			1	0	0	Air Data Rate 9.6k		
			1	0	1	Air Data Rate 19.2k		
			1	1	0	Air Data Rate 38.4k		
			1	1	1	Air Data Rate 62.5k		
03H	Read/ Write	REG1	7	6	Sub-Packet Setting		The data sent by the user is less than the sub-packet length, and the serial port output of the receiving end appears as an uninterrupted continuous output;	
			0	0	200 bytes (default)			
			0	1	128 bytes			
			1	0	64 bytes		The data sent by the user is larger than the packet length, and the serial port of the receiving end will be output in packets.	
			1	1	32 bytes			
			5	RSSI Ambient noise enable		After enabling, you can send commands C0 C1 C2 C3 in transmission mode or WOR sending mode to read registers; Register 0x00: Current environmental noise RSSI; Register 0x01: RSSI when receiving data last time (The current channel noise is: dBm = - (256 - RSSI)); Instruction format: C0 C1 C2 C3+start address+read length; Return: C1 + address + read length + read valid value; for example: send C0 C1 C2 C3 00 01 Return C1 00 01 RSSI (address can only start from 00)		
			0	Disable (Default)				
			1	Enable				
			4	3	2	Reserve		
			1	0	Transmitting Power		The relationship between power and current is non-linear, and the power supply has the highest efficiency at maximum power;	
			0	0	30dBm (default)			
			0	1	27dBm		The current will not decrease in the same proportion as the power decreases.	
			1	0	24dBm			
			1	1	21dBm			
04H	Read/ Write	REG2	Channel Control (CH) 0-80 represents a total of 81 channels				Actual frequency = 850.125 + CH *1M	
05H	Read/ Write	REG3	7	Enable RSSI Byte		After being enabled, the module receives wireless data and outputs it through the serial port TXD, followed by an RSSI strength byte.		
			0	Disable (Default)				
			1	Enable		During fixed transmission, the module will recognize the first three bytes of serial data as: address high + address low + channel, and use it as a wireless transmission target.		
			6	Transmission Method				
			0	Transparent transmission mode (default)				
			1	Fixed transmission mode				
			5	Reserve				
			4	LBT Enable				
			0	Disable (default)		After enabling, monitoring will be conducted before wireless data transmission, which can avoid interference to a certain extent, but may cause data delay;		
1	Enable							

										The maximum stay time of LBT is 2 seconds, and it will be issued forcibly when it reaches 2 seconds.	
			3	Reserve							
			2	1	0	WOR Cycle					
			0	0	0	500ms				Only valid for mode 1;	
			0	0	1	1000ms				Cycle T= (1+WOR)*500ms, the maximum is 4000ms, the minimum is 500ms;	
			0	1	0	1500ms					
			0	1	1	2000ms				The longer the WOR monitoring interval period, the lower the average power consumption, but the greater the data delay;	
			1	0	0	2500ms					
			1	0	1	3000ms					
			1	1	0	3500ms				Both sender and receiver must agree (very important)	
			1	1	1	4000ms					
06H	Write	CRYPT_H	Key high byte (default 0)								Write only, read returns 0; Used for encryption to avoid interception of wireless data in the air by similar modules;
07H	Write	CRYPT_L	Key low byte (default 0)								The module will use these two bytes as a calculation factor to transform and encrypt the air wireless signal.

7.3 Factory Default Parameter

Model	Factory default parameter: C0 00 00 62 00 17						
Model No.	Frequency	Address	Channel	Air Rate	Baud Rate	Serial Format	Power
E220-900T30S	873.125MHz	0x0000	0x17	2.4kbps	9600	8N1	30dbm

8. Configuration Instruction on Computer

- The following figure shows the display interface of the E220-900T22S configuration host computer. The user can switch to the command mode through M0 and M1, and quickly configure and read the parameters on the host computer.

- In the configuration of the host computer, the module address, frequency channel, network ID, and key are all displayed in decimal mode; the value range of each parameter:

Network address: 0~65535

Frequency channel: 0~83

Internet ID: 0~255

Key: 0~65535

9. Hardware Design

- It is recommended to use the DC stabilized power supply module for power supply, the power supply ripple coefficient is as small as possible, and the module must be reliably grounded;
- Please pay attention to the correct connection of the positive and negative poles of the power supply. Reverse connection may cause permanent damage to the module;
- Please check the power supply to ensure that it is within the recommended power supply voltage. If it exceeds the expected voltage, it will cause permanent damage to the module;
- Please check the stability of the power supply, the voltage cannot be extended to the maximum value;
- When designing the power supply circuit for the module, it is often recommended to reserve more than 30% margin, so that the whole machine is conducive to long-term stable operation;
- The module should be as far away as possible from the power supply, transformer, high-frequency wiring and other electromagnetic interference parts;
- High-frequency digital wiring, high-frequency analog wiring, and power wiring must avoid the bottom of the module. If it really needs to go under the module, assume that the module is soldered on the top layer, and ground copper on the top layer of the contact part of the module (all copper and well grounded), must be close to the digital part of the module and routed on the bottom layer;
- Assuming that the module is soldered or placed on the top layer, it is also wrong to randomly route the wires on the bottom layer or other layers, which will affect the stray and receiving sensitivity of the module to varying degrees;
- Assuming that there are devices that interfere with electromagnetic interference around the module, it will also greatly affect the performance of the module. According to the strength of the interference, it is recommended to separate the modules appropriately. If the situation permits, proper isolation and shielding can be done;
- Assuming that there are traces (high-frequency digital, high-frequency analog, power traces) that interfere with electromagnetic interference around the module, it will greatly affect the performance of the module. According to the strength of the interference, it is recommended to divide the module appropriately. If the situation permits, you can do the appropriate Isolation and shielding;
- If the communication line uses 5V parasitic, a 1k-5.1k resistor must be connected in series (not recommended, there is still a risk of damage);
- Try to stay away from part of the physical layer that is also 2.4GHz TTL protocol, such as: USB3.0;
- The antenna installation structure has an interference effect on the performance of the module, which can ensure that the antenna is exposed and preferably vertically upward;
- When the module is installed inside the case, a high-quality antenna extension cable can be used to extend the antenna to the outside of the case;
- The antenna must not be installed inside the metal shell, which will greatly shorten the transmission distance.

10. FAQ

10.1 Communication range is too short

- When there is a straight-line communication obstacle, the communication distance will be attenuated accordingly;
- Temperature, humidity, and co-frequency interference will increase the communication packet loss rate;
- The ground absorbs and reflects radio waves, and the test results near the ground are poor;
- Sea water has a strong ability to absorb radio waves, so the seaside test results are poor;
- If there is a metal object near the antenna or placed in a metal shell, the signal attenuation will be very serious;
- The power register setting is wrong, the air speed setting is too high (the higher the air speed, the closer the distance);
- The low voltage of the power supply at room temperature is lower than the recommended value, the lower the voltage, the lower the power output;
- The matching degree of the antenna and the module is poor or the quality of the antenna itself is problematic.

10.2 Module is easy to damage

- Please check the power supply to ensure that it is within the recommended power supply voltage. If it exceeds the maximum value, the module will be permanently damaged;
- Please check the stability of the power supply, and the voltage should not fluctuate greatly and frequently;
- Please ensure anti-static operation during installation and use, and high-frequency components are electrostatically sensitive;
- Please ensure that the humidity during installation and use should not be too high, and some components are humidity sensitive devices;
- If there is no special requirement, it is not recommended to use it at too high or too low temperature.

10.3 BER (Bit Error Rate) is high

- There is co-frequency signal interference nearby, stay away from the interference source or modify the frequency and channel to avoid interference;
- Unsatisfactory power supply may also cause garbled codes. Ensure the reliability of the power supply;
- Poor or too long extension cables and feeders can also cause high bit error rates.

11. Soldering Operation Guidance

11.1 Reflow Soldering Temperature

Profile Feature	Sn-Pb Assembly	Pb-Free Assembly
Solder Paste	Sn63/Pb37	Sn96.5/Ag3/Cu0.5
Preheat Temperature min (T _{min})	100°C	150°C
Preheat temperature max (T _{max})	150°C	200°C
Preheat Time (T _{min} to T _{max})(t _s)	60-120 sec	60-120 sec
Average ramp-up rate(T _{max} to T _p)	3°C/second max	3°C/second max
Liquidous Temperature (T _L)	183°C	217°C
Time (t _L) Maintained Above (T _L)	60-90 sec	30-90 sec
Peak temperature (T _p)	220-235°C	230-250°C
Average ramp-down rate (T _p to T _{max})	6°C/second max	6°C/second max
Time 25°C to peak temperature	6 minutes max	8 minutes max

13. Antenna Recommendation

Antennas are an important role in the communication process, and often inferior antennas will have a great impact on the communication system. Therefore, our company recommends some antennas as supporting our company's wireless modules with excellent performance and reasonable prices.

Model No.	Type	Frequency Hz	Interface	Gain dBi	Height mm	Feeder cm	Features
TX868-JZ-5	Rubber Antenna	868M	SMA-J	2.0	52	-	Ultra-short straight, omnidirectional antenna
TX868-JK-20	Rubber Antenna	868M	SMA-J	3.0	210	-	Bendable rubber, omnidirectional antenna
TX868-XPL-100	Suction Antenna	868M	SMA-J	3.5	290	100	Small suction antenna, cost-effective
TX915-JZ-5	Rubber Antenna	915M	SMA-J	2.0	52	-	Ultra-short straight, omnidirectional antenna
TX915-JK-11	Rubber Antenna	915M	SMA-J	2.5	110	-	Bendable rubber, omnidirectional antenna
TX915-JK-20	Rubber Antenna	915M	SMA-J	3.0	210	-	Bendable rubber, omnidirectional antenna
TX915-XPL-100	Suction Antenna	915M	SMA-J	3.5	290	100	Small suction antenna, cost-effective
